Hi,  
who is interested in a test using the QO-100 satellite on 9th May at 0800 UTC ? I have one or possibly two stations in the UK interested in trying the satellite for region wide communications and in earlier conversations I know some of you have the capability or are already using the satellite for routine nets.

Anyone interested who does not have the ability to transmit through the satellite could still listen through Web Software Defined Receivers such as;

<http://websdr.is0grb.it:8901/> <<http://websdr.is0grb.it:8901/>> or  
<https://eshail.batc.org.uk/nb/> <<https://eshail.batc.org.uk/nb/>>

Anyone taking part must have full duplex and be able to monitor their own signals. QO-100 is not a place to have bad signals or lots of QRM. I probably really need to know who is interested first, then we can develop how the test will take place.

73,

Greg, G0DUB
